

CONVERTIBLE SNOW SHOVELING DEVICE

ABSTRACT OF THE DISCLOSURE

A convertible snow shoveling device includes first and second shovels, each having a substantially planar blade, an elongated handle and a hand grip. At least one male connection part extends from an edge portion of the first shovel blade and at least one female connection part is disposed along an edge portion of the second shovel blade. The at least one female connection part of the second shovel blade is sized and shaped to receive the at least one male connection part of the first shovel blade to releasably couple the first and second shovel blades together and form the convertible shoveling device. A handlebar is provided for releasably coupling the hand grips on the first and second shovels together. The male and female connections together with the handlebar permit the pair of individual snow shovels to be easily converted from a pair of individual snow shovels into a wide blade double handle snow shoveling device.
